

Software license management with EasyLicenser provides these benefits to you and your end customers:

- Fast integration into your application
- Low-cost
- An array of license models, with unlimited expansion
- Robust security, even for Java applications
- Sales opportunity management and audit capabilities that enable you to maximize your revenues

## EASYLICENSER FEATURES

### CONVENIENCE AND SIMPLICITY

EasyLicenser is convenient for your end-user, with no installation and no separate license server to maintain for common licensing models. If you do wish to offer floating licensing or automated product activation please enquire about our Orion Network Licensing Platform.

EasyLicenser stays simple, even as end-users change their configurations (no need to contact you) or their licensing arrangements (just send a new key).

EasyLicenser also offers straightforward order processing, with a simple GUI to create and maintain license keys for your end-user and to generate reports tracking their status. Further simplicity comes from:

- Requiring only one EasyLicenser product license to cover all your products and versions,
- A single periodic license allows you to generate as many trial, subscription or perpetual licenses as you need,
- The ability of the license management user interface to run on all Java-capable platforms (e.g. Windows, Linux, Solaris).

### LICENSING CAPABILITIES

You can license-enable your end-users to have unlimited access to your product, or be limited by any combination of:

- The product options and features they can access,
- The length of time they can use the product, starting either from the date of key generation or the date of key installation,
- The number of metered operations they can perform.

EasyLicenser provides warnings that allow your end-users to contact you to extend their licenses as these limits expire.

### A RANGE OF LICENSE MODELS

EasyLicenser can generate licenses:

- For single-user desktop installations
- For server licensing, with the license further limited:
  - By the number of concurrent users,
  - By the number of named roles,
  - To a certain number of CPUs, or
  - To the total MHz of the CPUs.
- Customized for the models, features and options for your unique environment. Code samples are provided for common usage scenarios, with custom information embedded into the generated license keys.

### POWERFUL, NON-INTRUSIVE SECURITY

- Encryption: license key management based on public-key encryption,
- Anti-spoofing: protection from attempts to bypass license checks using reverse engineering and modifying libraries,
- Anti-cloning: protection from cloning keys issued by a vendor,
- Node-locking: locks license key to machine-specific parameters, either built-in operating system-level machine parameters or based on your own custom node-locking, with the the locking data either encrypted into the key when it is generated, or automatically read and locked to when the key is installed on the end-user's machine,
- State integrity: protection from attempts to defeat metered licenses by manipulating the system clock or rolling back state information,
- Audit: access-controlled auditing of your customers' keys.

## eCOMMERCE FEATURES

EasyLicenser's eCommerce capability enables you to integrate your web or other back-office order fulfillment system with EasyLicenser's key generation APIs in order to automate and streamline the process of issuing end-user license keys. The eCommerce options consist of:

- A Java key-generation API that is directly integrated with a Java-based back office system deployed on a J2EE application server or servlet engine.
- Command-line key-generation tools
- A self-contained web server that provides an HTTP-based key-generation API for integration with any local or remote back office system implemented in any Internet technology, for example ASP.Net, Perl.
- User-oriented web pages that enable back-office personnel to manually generate keys from any local or remote location over the Internet with a web browser.

## PLATFORMS AND LANGUAGE SUPPORT

EasyLicenser runtime libraries are available for copy protection of products based on:

- The **Java** platform on all Java-enabled platforms and environments
- **C/C++** on 32- and 64-bit Windows, Linux, Solaris Intel and Solaris SPARC , and MAC OS X universal binaries
- **All platforms:** Any programming language capable of calling out to Java or C (e.g. Delphi, Fortran).

## FURTHER INFORMATION

EasyLicenser is offered by Agilis Software LLC, developers of the complementary Orion Network Licensing Platform (<http://www.agilis-sw.com/orion>) and Acropolis Integration Manager (AIM)

For more information on EasyLicenser, Orion or AIM, please visit our web-site at <http://www.agilis-sw.com> or email us at [sales@agilis-sw.com](mailto:sales@agilis-sw.com).

## PURCHASING EASYLICENSER

A limited evaluation license is available to qualified prospective users. For production you purchase a periodic license (typically annual, although we also offer 2-year, 3-year, 4-year and perpetual licenses). This gives you the ability to issue as many trial or production licenses as you need in the license period for a single fee, with the fee being determined by the total revenues (license fee, subscription, maintenance and support) in the license period of the products being protected. The periodic license gives you access to all EasyLicenser's capability (e.g. trial licenses, perpetual licenses, subscription licensing, node-locked licenses, server licensing) on all supported platforms, for as many of your products as you wish to protect. EasyLicenser annual fees start at US\$5,000, represent a small percentage of the total revenues protected, and are very competitive with comparable solutions.
